

LESSON PLAN	COURSE: MDM4U
Date:	Unit of Study: Unit 4
Materials/Resources: Mathmetics of data management study guide	Lesson Focus/Theme: Chapter 7: Probability Distribution
Prior Knowledge: Introduction to probability	
Overall Expectations: By the end of this lesson, students will: demonstrate an understanding of continuous probability distributions, make connections to discrete probability distributions, determine standard deviations, describe key features of the normal distribution, and solve related problems from a variety of applications.	
Specific Expectations: 2.1 recognize and identify a continuous random variable (i.e., a variable that assumes values from the infinite number of possible outcomes in a continuous sample space), and distinguish between situations that give rise to discrete frequency distributions (e.g., counting the number of outcomes for drawing a card or tossing three coins) and situations that give rise to continuous frequency distributions (e.g., measuring the time taken to complete a task or the maximum distance a ball can be thrown) 2.2 recognize standard deviation as a measure of the spread of a distribution, and determine, with and without technology, the mean and standard deviation of a sample of values of a continuous random variable 2.3 describe challenges associated with determining a continuous frequency distribution (e.g., the inability to capture all values of the variable, resulting in a need to sample; uncertainties in measured values of the variable), and recognize the need for mathematical models to represent continuous frequency distributions 2.4 represent, using intervals, a sample of values of a continuous random variable numerically using a frequency table and graphically using a frequency histogram and a frequency polygon, recognize that the frequency polygon approximates the frequency distribution, and determine, through investigation using technology (e.g., dynamic statistical software, graphing calculator), and compare the effectiveness of the frequency polygon as an approximation of the frequency distribution for different sizes of the intervals	

Learning Goals:

By the end of this lesson, students will know the probability distribution and binomial distribution

Success Criteria:

By the end of this lesson, I will be able to know the probability distribution

By the end of this lesson, I will be able to know the binomial distribution

Assessment Strategies: Tests, quiz and project

Time:
10 min

Introduction/Minds-On:

Answer questions students don't understand from last class if any

Time:
80 min

Lesson:

Chapter 7: Probability distribution

7.1 Probability distribution

7.2 Binomial distribution

Time:

Extension / Wrap-up:

10 min

Review the key concepts and formula for this lesson

20 min

Do quiz #3

Notes / Reminders / Homework:

Review for the test

Lesson Reflection:
